

# Leatherman Side Project

January 3, 2024

## 1 Project Goals

To create an overview of data careers with the intent of helping those just entering the field to be familiar with it. We want to use data to help students decide on what to focus on if they want to be competitive with the rest of the field. This project was created by Practicum by Yandex.

Data is taken from New Coder (freecodecamp), Stack Overflow, and JetBrains global surveys of users. This allows a variety of responses from each source, but each must be understood for the biases it may present, such as New Coders only showing information from those about to or just joining the job market.

The ultimate goal of this project is to help the company offer useful and accurate representation and recommendations to those who are interested in pursuing a data career.

```
[ ]: import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
import numpy as np
sns.set_palette("bone")
```

Imported necessary packages, set seaborn palette for consistency.

```
[ ]: def hcountplot(data):
    ax = sns.countplot(y=data, palette="bone_r", order=data.value_counts().
        ↪index)
    ax.set(xlabel='count', ylabel='')
```

```
[ ]: def countplot(data):
    ax = sns.countplot(x=data, palette="bone_r", order=data.value_counts().
        ↪index)
    ax.set(ylabel='count', xlabel='')
```

```
[ ]: def hcountplotlimit(data, limit):
    ax = sns.countplot(y=data, palette="bone_r", order=data.value_counts().
        ↪iloc[:limit].index)
    ax.set(xlabel='count', ylabel='')
```

```
[ ]: def hcountplotmelt(data):
    melt_data = pd.melt(data)
```

```
ax = sns.countplot(y=melt_data['value'], palette="bone_r",
order=melt_data['value'].value_counts().index)
ax.set(xlabel='count', ylabel='')
```

```
[ ]: def hcountplotmeltlimit(data, limit):
    melt_data = pd.melt(data)
    ax = sns.countplot(y=melt_data['value'], palette="bone_r",
order=melt_data['value'].value_counts().iloc[:limit].index)
    ax.set(xlabel='count', ylabel='')
```

Defined functions for plotting to ensure uniformity.

```
[ ]: newcoder = pd.read_csv('datasets/newcoder.csv')
newcoder.head()
```

      <a list of 2 Text xticklabel objects>)
```

New Coder is able to show us some of the demographics of people just getting into the career. We can't use much of their data to look at the current state of the industry, but we can extrapolate it to those interested in the data career. Mostly, we get a good look at demographics and what they are hoping to find in the career, such as salary and work environment.

White is the majority ethnicity in data careers. Among the minorities, there is not a significant difference between them.

Stack Overflow gives us a very good look at the languages, salaries, and education of those actively working in the career. Stack Overflow is used by people all throughout IT to troubleshoot and discuss issues. We can see that the hopeful salaries from New Coders seems reasonable based on what we see in SO. We also get a good look at the different programming languages used.

```

Can't view age in a distplot like the others, but can see that it still lines up similarly to the other sources.

JetBrains data is primarily about which jetbrains software is used, not a lot of demographic information.

These surveys are very in-depth and offer lots of interesting conclusions. For the purpose of this project, different datasets might be more helpful. While there is something to be said for passively gaining demographics from the surveys on these sites, it does not seem to provide a very full picture. Some of our responses, such as different bootcamps, had only a few hits for each category, which is not very strong. In future, it might be interesting to go to different companies and view their stats on their employees. This would also help with the issue from New Coders, where there is only so far we can use that data, as most respondents have just started or not even started in the field, so their experience is not as helpful for others starting out.

Overall, we can see that while there are a few standards (white, male, 20s-30s), there are exceptions to almost everything. It seems that different genders and ethnicities are being recognized, and we can see that coding is something people can do at almost any age. There are lots of different methods and roads to get to a data career, but the information here at least shows what the

industry is primarily expecting from someone looking to join the ranks.
